GLENROCK, Wyo. (AP) - The Wyoming Department of Environmental Quality and a uranium company disagree whether problems occurred at a well at an in-situ mine north of Glenrock.

The DEQ has issued a violation notice against Cameco Resources, owner of the Smith Ranch-Highland uranium facility.

Wells at the facility have been drilled into uranium-bearing formations. The wells put a solution called lixiviant underground to leach uranium out of the rock.

A solution containing uranium is then pumped to the surface.

State regulators issued a violation notice in March after monitoring data showed that lixiviant may have spread from a ruptured well casing. Cameco officials shut down the well but say their own data show no leakage of mining solution.

Company spokesman Ken Vaughn says the violation was issued prematurely.
